14 - 15.04.2016, Rzeszów, Poland

Neutron Transmutation Doping of Silicon

Władysław Dąbrowski

Faculty of Physics and Applied Computer Science
AGH University of Science and Technology, Kraków

The neutron transmutation doping (NTD) of silicon is introduced from the point of view of power electronics requirements. Advantages of NTD technology and its applications are reminded. The history and present production capacity of NTD silicon is reviewed briefly. The current trends in power electronics industry and predictions for demands for NTD silicon in near future are discussed.
